

## Managing soil water

Preparing for your future anywhere in Europe? Be ready to confront the challenges facing your country and the world.

As an agriculture student you need to be aware of the problems and challenges facing our industry.

The course, Managing Soil Water, is about one of those challenges: having sufficient fresh water all of the time whilst avoiding waste. The course focuses on the availability of fresh water in different parts of the world and the relationship with agriculture/horticulture food production. The very high standards of Dutch horticulture food production will be used as an example together with examples that you will bring with you.

Would you like to learn from and discuss with an international group about this worldwide topic? Are you open to new experiences in another country and culture? Feel free to subscribe to this course and we will welcome you at Lentiz MBO Westland.
